Composition

Inhalation of nickel oxide at concentrations 50 times the PEL, produced pneumoconiosis in hamsters.

Repeated intratracheal instillation of nickel oxide produced an increased incidence of malignant lung tumors in rats.

The National Toxicology Program has listed nickel oxide as reasonably anticipated to be a carcinogen based on the production of injection-site tumors. The International Agency for Research on Cancer (IARC) concluded there was sufficient evidence that nickel compounds are carcinogenic to humans and that nickel oxide is carcinogenic to animals. The Report of the International Committee on Nickel Carcinogenesis in Man (Scandinavian Journal of Work, Environment & Health; Vol. 16, No.1; February 1990) reported that workers who have been primarily exposed to nickel oxide showed some evidence of increased lung cancer. Epidemiological evidence exists that nickel oxide is a nasal/sinus cancer hazard. Epidemiological studies of workers exposed to nickel powder and to dust and fume generated in the production of nickel alloys and stainless steel have not indicated the presence of a significant

There is some evidence that the inhalation of nickel oxide has resulted in an increased incidence of malignant lung tumors in rats.

The National Toxicology Program has listed nickel carbonate as reasonably anticipated to be a carcinogen based on the productions

of injection-site tumors. However, there is reason to believe that the compound actually testes was a basic nickel carbonate. The

Sinonasal cancer has been reported in a worker employed in an operation where a nickel-copper carbonate (formula unspecified)

International Agency for Research on Cancer (IARC) concluded there was sufficient evidence that nickel compounds are

HEALTH HAZARDS³

Nickel Oxide

LD50

Inhalation:

Wounds:

 LD_{50}

Inhalation:

BASIC NICKEL CARBONATE

Inhalation of dust may be irritating to the respiratory tract.

Skin Contact: Prolonged contact may irritate the skin and mucous membranes.

was decomposed to nickel-copper oxide.

compounds are carcinogenic when ingested.

The U.S. National Institute for Occupational Safety and Health (NIOSH) concluded there is no evidence that nickel and its inorganic Ingestion:

Nickel oxide has caused tumors at the site of injection in rodents.

The U.S. National Institute for Occupational Safety and Health (NIOSH) concluded there is no evidence that nickel and its inorganic Ingestion: compounds are carcinogenic when ingested. PRECAUTIONS FOR SAFE STORAGE, HANDLING AND USE

A chemical alleged to be nickel carbonate but which was probably a basic nickel carbonate and dried crystalline nickel hydroxide

Do not inhale. Keep container closed when not in use. Ventilation is normally required when handling or using this product to keep exposure to airborne nickel below the exposure limit. If ventilation alone cannot so control exposure, use NIOSH-approved respirators selected according to

May cause eye irritation.

caused tumors at the site of injection in rodents.

OSHA 29 CFR 1910.134. Maintain the airborne concentration of nickel oxide as low as possible.

SPILL, LEAK AND DISPOSAL PROCEDURE Collect spills by wet sweeping or by vacuuming with the vacuum exhaust passing through a high efficiency particulate arresting (HEPA) filter if the

exhaust is discharged into the workplace.

Eye Contact:

Wounds:

Wear appropriate NIOSH-approved respirators if collection and disposal of spills is likely to cause the concentration of airborne contaminants to exceed the exposure limits.

Nickel-containing waste is normally collected to recover nickel values. Should waste disposal be deemed necessary, follow EPA and local regulations.

EMERGENCY AND FIRST AID PROCEDURES

Cleanse wounds thoroughly to remove any particles.

SARA SECTION 313 SUPPLIER NOTIFICATION

This product contains the following chemical(s) subject to the reporting requirements of Section 313 of the Emergency Planning and Community Righto-
